

Sampling Plan

Target Population

KIU undergraduate students in the **Computer Science, Management, and Mathematics** schools, from **2nd through 4th year**.

First-year students were excluded because they are unlikely to have engaged meaningfully with internship search or support services at this stage of their studies. Students from other, newly introduced KIU majors were excluded because these programs are too recently established to have sufficient institutional information on their internship support provisions.

Accessible Population

KIU undergraduates reachable through class groups, student communication channels, personal academic networks, and university-related online groups.

Sampling Method

Convenience sampling — a non-probability method, chosen for practicality given the course project's limited timeframe. It does not produce a fully representative sample of all KIU undergraduate students.

Sample Size Targets

Threshold	N	Purpose
Minimum	40	Floor for descriptive reporting
Preferred	70	Target for the class project
Stretch	150+	Enables meaningful subgroup comparisons

Achieved: 122 valid responses, above the preferred target and within the stretch range. Group split: 38 support users, 84 non-users — both groups large enough for the planned Welch t-test.

Recruitment Channels

- KIU class group chats
- Student association groups
- KIU undergraduate class networks
- Personal academic contacts
- Instructor-approved announcements

Inclusion Criteria

Participants must:

- Be a current KIU undergraduate in 2nd, 3rd, or 4th year
- Be enrolled in Computer Science, Management, or Mathematics
- Participate voluntarily
- Complete the consent question before answering the survey

Exclusion Criteria

Exclude responses if:

- The respondent does not consent
- The respondent is not a KIU undergraduate student
- The respondent is a 1st-year student
- The respondent is enrolled in a major outside the three target schools
- The response is largely incomplete
- The response appears duplicated or unserious
- The response includes direct identifiers in open-ended fields that cannot be safely anonymized

Applied result: all 122 collected responses met the inclusion criteria; none required exclusion.

Duplicate Prevention

A single official form link was used throughout, and Google Forms was configured to accept **only one response per account**. This prevented duplicate submissions at the point of collection without recording any email address or identifier in the exported data. Screening confirmed no duplicate rows.

Sampling Limitation Statement

Report wording:

Because the study used convenience sampling, the findings should be interpreted as perceptions of the surveyed students rather than as statistically representative evidence for all KIU undergraduates.

Note that the achieved sample skews toward 3rd-year (68.0%) and Computer Science (62.3%) students, so Management (27.9%) and Mathematics (9.8%) subgroups should be reported with caution.

Collection Window

The form was open for eleven days, from **28 June to 8 July 2026**.
